

Walkthrough Script — Noto

Target length ~2.5–3 minutes at <https://noto-apps.vercel.app>.

Each beat below has two columns: **DO** (what to click / show) and **SAY** (the words to speak). Read down the SAY column; glance at DO for the action.

Before you hit record

- Open **Window A** (normal) → will log in as **Ada**.
- Open **Window B** (incognito) → will log in as **Grace**. Two windows = show two users without re-logging-in on camera.
- Open the app once to **wake the Supabase project** (free tier pauses).
- Have an import file ready (any `.md` / `.docx`, e.g. `meeting-notes.md`).

The script

1 • Intro — 0:00 (~15s)

DO	SAY
Show the login screen.	"Hi, I'm Jay. This is Noto — a lightweight collaborative document editor inspired by Google Docs, built for the Ajaia AI-Native assessment. It's a Next.js app on Vercel with Supabase for data and storage."

2 • Framing / product judgment — 0:15 (~20s)

DO	SAY
Stay on the login screen.	"My goal wasn't to clone all of Google Docs — it was to ship one coherent, fully working slice and be explicit about tradeoffs. So I went deep on three things: the editing experience, sharing with real access control, and persistence."

3 • Login + dashboard — 0:35 (~15s)

DO	SAY
Click Ada Lovelace . Point at " Owned by you " vs " Shared with you ."	"Auth is simulated seeded accounts — no passwords — which keeps the focus on documents and sharing. Here's Ada's dashboard: what she owns, versus what's shared with her."

4 • Editor + formatting — 0:50 (~30s)

DO	SAY
Open " Welcome to Noto ." Select text → Bold , Italic , Underline . Toggle a Heading . Make a bulleted then numbered list.	"The editor's built on Tiptap — bold, italic, underline, headings, and bulleted or numbered lists. It feels like a real document, not a textarea."

5 • Autosave + rename — 1:20 (~15s)

DO	SAY
Type a few characters. Point at the save indicator . Edit the title inline.	"Everything autosaves — debounced — with a live status indicator, and you can rename inline. I'll refresh at the end to show it all persists."

6 • Sharing — 1:35 (~30s)

DO	SAY
Click Share . Point at Ada = Owner , Alan = Editor . Type grace@noto.test , keep Viewer , add.	"Sharing uses an owner model — the owner grants viewer or editor access by email, and can revoke it. I'll add Grace as a viewer. Access control lives in one pure function on the server that every route checks, so it can't be bypassed."

7 • Viewer = read-only — 2:05 (~25s)

DO	SAY
Switch to Window B (Grace) . Refresh → doc under "Shared with you" with a Viewer badge. Open it.	"Now as Grace — the document appears under 'Shared with you', and because she's a viewer it opens read-only : no toolbar, a 'view only' banner. Only editors can change content, only owners can share or delete — and that's enforced in the API, not just hidden in the UI."

8 • File import — 2:30 (~20s)

DO	SAY
Back as Ada → Import file → pick a .md / .docx .	"You can also import a text, Markdown, or Word file — it converts to a new editable document with formatting preserved, and the original is stored too. Unsupported types are rejected with a clear message."

9 • Tradeoffs + next + close — 2:50 (~20s)

DO	SAY
(Optional) Refresh a doc to show persistence.	"Two deliberate cuts: no real-time multi-cursor collaboration, and I enforce authorization in app code rather than Postgres RLS — both documented, both already supported by the data model. With a few more hours I'd add real-time collab with Yjs and move to Supabase Auth with RLS. AI tools helped me move fast, but the design and the verification were mine. Thanks for watching."

Delivery tips

- Keep the cursor moving with your words; pause ~1s after each click so it's followable.
- Don't read verbatim — these are prompts. Energy and clarity beat perfection.
- Fluff a line? Pause and repeat the sentence; trivial to trim.
- Running long? Drop the optional persistence refresh and tighten beats 4–5.

60-second short version (if you need it)

Beats **1** → **3** → **4** → **6** → **7** → **8** only: intro, dashboard, formatting, share with Grace, show Grace's read-only view, import a file. Skip framing, autosave detail, and the closing tradeoffs.
